# Agenda :

- What is Software & Its Need
- What is Software Testing
- Different Types of software Testing
  - Manual
  - Automation
- Roles & Growth in software testing
- Career as software tester
- Why Automation Testing
- Why Selenium + Python
- FAQ

# What is Software :

What is Software

## A collection of colorful icons representing various aspects of IT and business. The icons include a magnifying glass, a database cylinder, a network diagram, a screwdriver, gears, a clock, a checklist, a flame, a recycling symbol, a star, and a code editor. The icons are arranged in a circular pattern, suggesting a cycle or a comprehensive set of services. The background is a solid blue color.

# Types of software testing

Software testing assesses the functionality of a software program.

## REGRESSION TESTING

ensures whether the addition of new features causes a decline in the functionality of an application. It's typically repeated after each build.

## UNIT TESTING

ensures each individual unit or component performs as expected. It's typically conducted during the app development phase.

## FUNCTIONAL TESTING

checks each function against functional requirements. A black-box test is a common example.

## INTEGRATION TESTING

groups together two or more modules of an application to make sure they can function collectively.

## STRESS TESTING

assesses the strength of software by testing how much load it can take before reaching a breaking point.

## SECURITY TESTING

ensures software is free of potential vulnerabilities, known flaws and security loopholes that might affect the user system and data.

## PERFORMANCE TESTING

tests the performance, speed and scalability of an application under a given workload.

## ACCEPTANCE TESTING

evaluates the entire system against the desired requirements to confirm project completion.
